What They're Reading At Vandy

Brought to you by
AudiologyOnline

A book that you'll *hopefully* see fairly soon!

Chapter 6 is all about the self-assessment inventories used in the *pre-fitting* of hearing aids.

We selected seven scales that we thought you might be interested in using.

Vanderbilt Bill Wilkerson Center

Some tests that you could use to learn more about your hearing aid patients

Hearing Handicap Inventory for the Elderly/Adult (HHIE/A)

- Measures the degree of handicap for emotional and social issues related to hearing loss.

Abbreviated Profile of Hearing Aid Benefit (APHAB)

- Provides “percent of problems” the patient has for three different listening conditions involving speech understanding (in quiet, in background noise and in reverberation) and problems related to annoyance of environmental sounds (aversiveness scale).

Vanderbilt Bill Wilkerson Center

Some tests that you could use to learn more about your hearing aid patients

Expected Consequences of Hearing Aid Ownership (ECHO)

- Measures the patient’s expectations for four different areas: Positive Effect, Service and Cost, Negative Features and Personal Image.

Client Oriented Scale of Improvement (COSI)

- Requires patient’s to identify 3-5 very specific listening goals/communication needs for amplification. Can then be used to measure patient expectations related to these specific goals..

Vanderbilt Bill Wilkerson Center

Some tests that you could use to learn more about your hearing aid patients

Hearing Aid Selection Profile (HASP)

- Assesses eight patient factors related to the use of hearing aids: Motivation, Expectations, Appearance, Cost, Technology, Physical, Communication Needs, and Lifestyle.

Link for form and scoring: <http://www.audiologyonline.com/ask-the-experts/hasp-self-assessment-inventory-13>

Characteristics of Amplification Tool (COAT)

- Nine questions designed to determine patient's communication needs, motivation, expectations, cosmetic and cost concerns.

<http://www.audiologyonline.com/articles/improving-efficiency-and-accountability-hearing-995>

Vanderbilt Bill Wilkerson Center

Some tests that you could use to learn more about your hearing aid patients

Profile of Aided Loudness (PAL)

- Assesses the patient's loudness perceptions, and satisfaction with these perceptions for 12 different everyday environmental sounds.

Vanderbilt Bill Wilkerson Center

Vanderbilt Bill Wilkerson Center

In his first editorial, Dr. Jacobson talks about “Flotsam, Jetsam and Jerger.”

Editorial

The Torch Is Passed

DOI: 10.5168/jaaa.55.1.1

I have a couple boxes of flotsam and jetsam that I have acquired over the years. They contain items that I have had many opportunities to discard but have refused to part with, things I have packed and repacked through several moves. One of the items is a letter from the registrar at Vanderbilt University, dated March 14, 1975, denying me entry to the Ph.D. program. The letter is a reminder to me that life is steeped in irony. Vanderbilt University is, of course, the university where for the past sixty years I have valued participation as a clinician and have taught students and conducted

“It should be very concerning that there are few audiologists out there who are prepared to assume that great weight of responsibility for moving our great profession forward” (Jacobson, 2002, p. 54).

For so many of us, despite how humble he is, Dr. James Jerger always has been “THE MAN” in my hospital letters. A friendly and supportive comment from the Jerger in front of a poster or after a talk sustained us through grant and manuscript rejections. His name is synonymous with translational research. He is one of the reasons why I became an audiologist.

Vanderbilt Bill Wilkerson Center

I can't quite read that. Is that your projected article acceptance/rejection rate for JAAA for 2012?

No . . . That's actually a scan of our dinner receipt from last night. I was hoping you'd pay half?

Vanderbilt Bill Wilkerson Center

Vanderbilt Audiology Journal Club
**Topic: Assessing Dizziness
 and Vertigo**
 3 ½ Helpful Questionnaires

Gary P. Jacobson, Ph.D.
 Division of Audiology

Balance Function Testing

- Begins with bedside tests as a means for creating hypotheses for what will be the results of q-tests.
- For the same reason also administer:
 - case history,
 - screening instrument for anxiety and depression (e.g. Chronic Subjective Dizziness - CSD),
 - measure of dizziness handicap...

Vanderbilt Bill Wilkerson Center

Paper-Pencil Measures That are Useful in the Balance Disorders Laboratory

- Dizziness Handicap Inventory (DHI)
- Hospital Anxiety and Depression Scale (HADS)
- Structured Interview for Migrainous Vertigo (SIM-V)
- “Expert” Structured Case History

Vanderbilt Bill Wilkerson Center

Dizziness Handicap Inventory (DHI) - Background

Vanderbilt Bill Wilkerson Center

Methods of Evaluating Disability/Handicap

- Home made questionnaires (not standardized)
- Outcomes measurement instruments (less subjective) that can be:
 - e.g. General (SF-36), or,
 - Disorder (modality)-specific (i.e. hearing loss, dizziness, tinnitus)

Vanderbilt Bill Wilkerson Center

Why Administer Quantitative Self-Report Measures?

- They provide:
 - evidence to patients and 3rd party payers that rehabilitative services are beneficial and cost-effective
 - unique information unavailable and unpredicted from quantitative tests
 - This information may be “diagnostic”

Vanderbilt Bill Wilkerson Center

Devices Used for Measuring Dizziness Disability/Handicap

- Assessment of disability/handicap
 - Dizziness Handicap Inventory (DHI), Jacobson & Newman (1990)
 - Vertigo Handicap Questionnaire (VHQ), Yardley and Putnam (1992)
 - Subjective Disability Scale/Post-Therapy Symptom Score (SDS), Shepard et al. (1993)

Vanderbilt Bill Wilkerson Center

Addt'l Devices Used for Measuring Dizziness Disability/Handicap

- Assessment of Handicap (Cont'd)
 - Activities-specific Balance Confidence (ABC) Scale, Powell & Myers (1995)
 - UCLA Dizziness Questionnaire (UCLA-DQ), Honrubia et al. (1996)
 - Vestibular Disorders Activities of Daily Living (VADL) Scale, Cohen and Kimball (2000)

Vanderbilt Bill Wilkerson Center

Dizziness Handicap Inventory - DHI Modality-specific Self-Report Measure

- 25-item self-assessment inventory designed to measure the impact that dizziness and unsteadiness has on a patients quality of life

The Development of the Dizziness Handicap Inventory

Gay E. Jacobson, PhD; Craig W. Newman, PhD

Vanderbilt Bill Wilkerson Center

Dizziness Handicap Inventory

- 25 questions are answered using a “yes,” 4 pts “sometimes,” 2 pts. and “no,” 0 pts. format.
- Total score ranges between “0” and “100” (0-100 maximum handicap)

Q#	Statement	Yes	Sometimes	No
01	When walking do you feel dizzy?			
02	Because of your problem do you feel nervous?			
03	Because of your problem do you usually get tired by walking or working?			
04	When walking do you miss a step or stumble?			
05	Because of your problem do you have difficulty getting into or out of bed?			
06	Does your problem significantly affect your performance in social situations such as going out to dinner, going to the movies, dancing, etc. to parties?			
07	Because of your problem do you have difficulty reading?			
08	Does performing more activities at home like washing, cleaning, household chores, such as laundry or putting dishes away, decrease your productivity?			
09	Because of your problem are you afraid to leave your home without having someone accompany you?			
10	Because of your problem have you been unable to get a job or to change jobs?			
11	Do you have any problems with your eyesight?			
12	Because of your problem do you avoid heights?			

Vanderbilt Bill Wilkerson Center

Dizziness Handicap Inventory (DHI)

- 3 subscales: functional, emotional and physical
- Factor analyses failed to support the empirically-derived factor structure of the DHI
 - Clinical application should be limited to total score

Vanderbilt Bill Wilkerson Center

NAME: _____ DATE: _____

DIZZINESS HANDICAP INVENTORY (DHI)

Instructions: The purpose of this questionnaire is to obtain information about the degree of handicap caused by the dizziness syndrome. There are no "right" or "wrong" answers to this questionnaire. Answer each question to the best of your knowledge.

Q#	Statement	Yes	Sometimes	No
01	When walking do you feel dizzy?			
02	Because of your problem do you feel nervous?			
03	Because of your problem do you usually get tired by walking or working?

24	Because of your problem do you have difficulty walking on stairs?			
25	Because of your problem do you have difficulty walking on uneven surfaces?			

Vanderbilt Bill Wilkerson Center

Psychometric Adequacy of DHI
 Internal Consistency Reliability
 Test-retest Reliability

- Cronbach's alpha for total and subscales 0.72-0.89
- High test-retest reliability ($r = 0.97$; 95% confidence interval = 18 pts)

Vanderbilt Bill Wilkerson Center

Psychometric Adequacy of DHI
 Validity of DHI

- Total DHI score increases with increased frequency of vertiginous spells

Vanderbilt Bill Wilkerson Center

Psychometric Adequacy of DHI
 Interquartile Ranges-Freq of Spells

Jacobson and Newman, 1990; Jacobson and McCaslin, 2006

Range	Classification	Freq. of Episodes	Mean Total DHI-T
0-14	None	-	-
16-26	Mild	Occasionally (<12/yr)	25
28-44	Moderate	Frequently (≥ 12 /yr)	34
>44	Severe	Continuously	49

Significant differences between occasionally and frequently, occasionally and continuously and frequently and continuously

Numbers of Investigations re: Dizziness Disability/Handicap 1966-2012

Courtesy of E.G. Piker, Ph.D.

Vanderbilt Bill Wilkerson Center

Aside from obvious clinical applications, what can you do with standardized self-report measures?

Vanderbilt Bill Wilkerson Center

Article 1: Whitney et al. 2005

Otolaryngology
2007; 135: 200-205, Otolaryngology, Inc.

Usefulness of the Dizziness Handicap Inventory in the
Screening for Benign Paroxysmal Positional Vertigo

*||Susan L. Whitney, ||Gregory F. Marchetti, and ||Laura O. Morris

*Departments of Physical Therapy and Otolaryngology, University of Pittsburgh,
||Centers for Rehabilitation Services, University of Pittsburgh Medical Center, and
||Duquesne University, Pittsburgh, Pennsylvania, U.S.A.

Vanderbilt Bill Wilkerson Center

Introduction BPPV

- Affects an estimated 17%-22.5% of patients seen in a dizziness clinic
- Incidence is ~1:1500 with a greater incidence with increased age
- Older patients with undiagnosed BPPV have a greater number of falls, depression, and impairments of ADLs
- Diagnosis of anterior and posterior SCC BPPV:
 - "Dix-Hallpike test"
- Diagnosis of horizontal canal BPPV:
 - "head-roll test"

Vanderbilt Bill Wilkerson Center

DHI

- Whitney et al. (2005) proposed that positive endorsements of specific items within the DHI (i.e. physical subscale) could increase the level of suspicion that BPPV might exist
- Hypothesized that responses to those 5 items would assist physician in making an accurate diagnosis of BPPV

Vanderbilt Bill Wilkerson Center

Created a “Mini DHI”
(My words not Whitney et al.)

- **Item content:**
 - Looking up
 - Difficulty getting out of bed
 - Quick head movements
 - Rolling over in bed
 - Bending over
- Created 5-item, and then 2-item “mini-DHIs”

Vanderbilt Bill Wilkerson Center

DHI as a Predictor of BPPV
Whitney, Marchetti, Morris, 2005

- **P1 – Does looking up increase your problem?**
- ***F5 – Because of your problem do you have difficulty getting into, or out of, bed?**
- **P11 – Do quick movements of you head increase you problem?**
- ***P13 - Does turning over in bed increase your problem?**
- **P25 - Does bending over increase your problem?**

*From 2-item DHI

Vanderbilt Bill Wilkerson Center

Methods

- **Retrospective chart review between Sept. 1998 and March 2003.**
- **N = 373**
 - **90% referred from ENTs & neurologists**
 - **22% of sample with dx of BPPV (positive Dix-Hallpike maneuver)**
 - **45.6% with dx of dizziness**
 - **16.6% with dx of gait impairment**

Vanderbilt Bill Wilkerson Center

DHI-t scores for those with, and without, BPPV were not significantly different

TABLE 2. Dizziness Handicap Inventory total score and subscores (functional, emotional, and physical) for newly diagnosed benign paroxysmal positional vertigo patients for persons with and without benign paroxysmal positional vertigo and all patients participating in vestibular therapy

	BPPV	Non-BPPV	All patients
Mean	47.6 ± 17.8	46.0 ± 17.6	45.8 ± 17.7
Median	45	45	45
SD	18.0	18.0	18.0
Range	0-100	0-100	0-100
Subscores			
Mean	13.8 ± 9.4	14.1 ± 9.7	13.9 ± 9.7
Median	12	12	12
Range	0-31	0-36	0-36
Mean	10.8 ± 6.6	11.4 ± 7.6	11.2 ± 7.1
Median	9	11	10
Range	0-24	0-30	0-30
Mean	23.0 ± 11.1	20.5 ± 11.6	21.7 ± 11.1
Median	17	17	17
Range	0-55	0-70	0-70

All values were derived from the total score. Mean, Whitney U = 2.17, p = 0.03; Median, Whitney U = 2.14, p = 0.03; Range, Whitney U = 2.15, p = 0.03.

Vanderbilt Bill Wilkerson Center

Results: Estimated Probabilities and Computed Likelihood Ratios (LR)

- LR is the "...likelihood that a particular test finding would be seen in a patient with BPPV relative to the chance that the same result would be seen in a patient without BPPV"
- LRs were calculated for both the sum of the 2 item DHI (i.e. "getting out of" and "rolling over" in bed") and the sum of the 5-item DHI

Vanderbilt Bill Wilkerson Center

DHI as a Predictor of BPPV

Whitney, Marchetti, Morris, 2005

- Patients scoring 20 pts (100%) on the 5-item scale ("yes" X 5) had a 35% probability of having BPPV
- Patients scoring 4 pts. (i.e. "sometimes" X 2) on the 2-item version
 - 2.7X risk of having BPPV
- Patients scoring 8 pts on the 2-item version (i.e. "yes" X 2)
 - 4.3X risk of having BPPV

Vanderbilt Bill Wilkerson Center

Results 5 item mini DHI

- Probability of having BPPV for patients scoring:
 - 0 pts = 12%
 - 10 pts = 21%
 - 20 pts = 35%

FIG. 2. Estimated probability of having BPPV given responses to DHI items: 1 (looking up), 5 (getting out of bed), 11 (quick head movements), 13 (rolling over in bed), and 25 (benching in individuals presenting to subspecialty and falls clinic; n = 270). Item of responses: (looking up) = (getting out of bed) = (quick head movement) = (turning over in bed) = (benching over/2) = 100.

Vanderbilt Bill Wilkerson Center

What, if any, is the usefulness of the mini-DHI (either 2- or 5-item)

- Short to administer to screen for administering the Dix-Hallpike maneuver
- Provides a means of hypothesizing what will be the results of other tests in the battery (e.g. Dix-Hallpike or head roll)
- Might be useful as screening tool in IM or geriatrics to gate the flow of patients to imaging

Vanderbilt Bill Wilkerson Center

Structured Interview for Migrainous Vertigo - SIM-V Background

Vanderbilt Bill Wilkerson Center

Famous Migraineurs

Vanderbilt Bill Wilkerson Center

Statistics: Migraine Headaches

- 28 million Americans suffer from migraine headaches
- 50% experience migraine headache but have not been diagnosed.
- 39% of migraineurs do not seek medical help
- 21% of those diagnosed with migraine discontinue medical care because of inadequate treatment

Vanderbilt Bill Wilkerson Center

Statistics: Migraine Headaches

- 70% of the 1 million headache consultations are conducted by primary care physicians
- 20% report headache as the reason for their initial physician visit
- Migraineurs have tried, on average, 4.6 different medications before finding effective treatment!!
- Some patients feel migraine headache is a fact of life.

Vanderbilt Bill Wilkerson Center

Inheritance of Migraine

- Migraine is an inherited neurological disorder
 - ~90% of migraineurs have a primary relative with migraine headache
- Migraineurs have sensitive CNS that can be disrupted by: sleep deprivation, strong odors, traveling, skipping meals, stress, sex and changes in hormone levels

Vanderbilt Bill Wilkerson Center

Epidemiology

- Women experience 2-3x more often than men
- Begin during childhood or adolescence
- For children equally distributed between boys and girls
- During early adolescence more women than men
- After menopause estrogen levels decrease and stabilize reducing migraine frequency
- Therefore if women are placed on HRP, migraine can become persistent into later life

Vanderbilt Bill Wilkerson Center

Epidemiology

- Can begin having migraine when taking antihypertensives, oral contraceptives, HRP however migraine usually occurs due to multiple coexisting triggers
- Frequency of migraine
 - 59% = 1- 4 attacks/month,
 - 22% = 10 or more attacks/month
- Headaches last 24-72 hours

Vanderbilt Bill Wilkerson Center

Epidemiology

- Headache can be disabling and handicapping
- Poorly controlled migraine can result in a downward socioeconomic spiral.

The Henry Ford Hospital Headache Disability Inventory (HDI)

Vanderbilt Bill Wilkerson Center

“Migraine-associated Vertigo” aka “Migraine-related Vertigo” aka “Migrainous Vertigo”

- Terms may describe:
 - symptoms where migraine and vertigo co-occur in the same patient, or
 - where vertigo symptoms are integral part of migraine symptomatology (term is “migrainous vertigo”)
- Migraine as the cause of vertigo estimated to occur in:
 - 35% of pediatric patients and
 - ~6% of adult patients seen for dizziness

Vanderbilt Bill Wilkerson Center

Vestibular Pathology in Migraine

- Spontaneous and/or positional nystagmus: 5-15%
- Abnormal caloric test: 8-24%
- Abnormal posturography: 26-33%

Vanderbilt Bill Wilkerson Center

From: Marcus et al. 2004

- Neuhauser et al. 2001 developed criteria to define migrainous vertigo
- Using criteria, Neuhauser et al. identified migrainous vertigo in 9% of migraine patients (~1:10?)

Table 1. Neuhauser's diagnostic criteria for migrainous vertigo (Adapted from Neuhauser, 2001).

Diagnosis of migrainous vertigo requires ALL of the following:	
1. Lifetime diagnosis of migraine	3. One or more migraine symptoms has occurred with episodic vestibular attacks.
2. Vestibular symptoms that	a. Migraine headache OR
a. Are intermittent, not constant, AND	b. Photophobia, OR
b. Are more than simple dizziness (e.g., vertigo, illusory motion, or head motion intolerance), AND	c. Phonophobia, OR
c. Interfere with daily activities, AND	d. Aura (other than disturbance)
d. Are not caused by identified pathology	4. No hearing loss or neurologic or otologic pathology to explain balance abnormalities (E.g., patients with Meniere's disease would not be diagnosed with migrainous vertigo).

Vanderbilt Bill Wilkerson Center

Using Neuhauser et al. 2001 Criteria

- Furman et al. (2003) developed a structured interview for migrainous vertigo (SIM-V)
- Structured interview results in a standardized application of the criteria
- Study objective:
 - test the reliability of structured interview compared to physician assessment (i.e. agreement between SIM-V and clinical assessment)

Vanderbilt Bill Wilkerson Center

Sim-V - Marcus et al. 2004 (Flow sheet)

Table 2. Structured interview for migrainous vertigo (GM-V; adapted from Furman, 2002).

- Do you have migraines?
 - Migraine with aura (define aura _____)
 - Migraine without aura
 - Must have 4 or more episodes of headache associated with:
 - at least two of the following: unilateral location, throbbing pain, moderate to severe pain, or worsened by performing routine activities, AND
 - 1 of the following: photophobia and phonophobia, or nausea, AND
 - full or partial recovery by known pathophysiology.
- NO/STOP/YES (if yes, proceed to next question.)
- Do you sometimes experience any of the following:
 - Dizziness or lightheadedness
 - Vertigo
 - A feeling of abnormal motion
 - Like walking on the deck of a boat
 - Objects in the room seem to spin or turn around you
 - You feel like you're spinning or turning, when you're really not moving
 - Sense of imbalance, abnormal motion, rotation, or sways when you move your head
 - Tendency to sway to the side when trying to walk straight.

If none or only dizziness/lightheadedness, STOP.

If symptoms other than dizziness/lightheadedness, then proceed to next question.

 - Have you ever been evaluated for symptoms of dizziness, vertigo, or a balance disorder?
 - YES: What was your diagnosis?
 - NO (if NO, proceed to next question)

Vanderbilt Bill Wilkerson Center

SIM-V Marcus et al. 2004

- Do you have chronic, recurring, lightheadedness or tilting in your ears along with your balance problems?
 - YES: answer question (STOP)
 - NO to both questions (if NO, proceed to next question)
 - Do you have abnormal balance symptoms all the time or do they come and go?
 - If you have bilateral symptoms all the time, does the severity fluctuate?
 - Constant (AND fluctuating) (STOP)
 - Intermittent or fluctuating in severity (if intermittent or fluctuating, proceed to the next question.)
 - How do your episodic or fluctuating symptoms of imbalance interfere with your daily activities:
 - Symptoms do not interfere. (Rate as Mild) and STOP.
 - Symptoms usually interfere but do not prohibit daily activities. (Rate as MODERATE and continue to the next question.)
 - Symptoms usually prohibit daily activities. (Rate as SEVERE and continue to next question.)
 - Has one of the following symptoms occurred at least twice in the same flow that you experienced either episodic balance attacks or when you experienced increased severity of fluctuating balance symptoms?
 - Migraine headache (as defined by the Headache Diagnostic Interview)
 - Markedly increased sensitivity to SILENT normal room lighting OR conversational speech (The person should report a need to turn down or off lights, radio, television, close curtains or blinds, or need to retreat to dark, quiet rooms)
 - Migrainous aura (visual scintillations, visual hallucinations, weakness or numbness on one side of the body; DO NOT score positive if the "aura" symptom is dizziness)
- If YES, then diagnosis: **MIGRAINOUS VERTIGO**. If NO, no diagnosis of migrainous vertigo.
- Migrainous vertigo is diagnosed when the subject proceeds through the entire interview, and answers "YES" to question 1. Patients whose responses cause a "STOP" signal at any point during the interview probably do not have migrainous vertigo.

Vanderbilt Bill Wilkerson Center

Methods

- N = 17
- Evaluated by
 - neurologist to confirm diagnosis of migraine (IHS)
 - neurotologist to confirm diagnosis of migrainous vertigo
- Separately, all subjects independently screened by an RN using SIM-V
- 82% of subjects retested (t/r reliability)

Table 3. Subject demographics.

FEATURE	All Subjects (N = 17)	Subjects completing re-test (reliability) (N = 14)
Gender: number (%)		
Female	15 (88.2)	12 (85.7)
Male	2 (11.8)	2 (14.3)
Age: mean ± SD (years)	32.8 ± 7.0	32.8 ± 7.0
Race: number (%)		
Caucasian	13 (76.5)	11 (78.6)
African-American	3 (17.6)	3 (21.4)
Asian	1 (5.9)	

SD = standard deviation

Vanderbilt Bill Wilkerson Center

Analyses and Results

- Comparison between MD and nurse (i.e. SIM-V) diagnosis: kappa = 0.75
 - i.e. $\geq .60$ good validity
 - $\geq .75$ excellent validity
- Predictive values: sensitivity = 71%, specificity = 100% and
- Test/retest reliability (N= 14; mean interval 178 days): kappa = 0.75

Table 4. Agreement for diagnoses of migrainous vertigo and no migrainous vertigo between physician and nurse-administered SIM-V questionnaire (visit 1).

	Physician migrainous vertigo	Physician no migrainous vertigo	Total
SIM-V migrainous vertigo	5	0	5
SIM-V no migrainous vertigo	2	10	12
Total	7	10	17

Cohen's kappa = 0.75

Table 5. SIM-V test-retest reliability (questionnaire visit 1 vs. visit 2).

	SIM-V visit 1 migrainous vertigo	SIM-V visit 1 no migrainous vertigo	Total
SIM-V visit 2 migrainous vertigo	5	0	5
SIM-V visit 2 no migrainous vertigo	1	8	9
Total	6	8	14

Cohen's kappa = 0.85

*Cohen's kappa is an index of inter-rater agreement

Vanderbilt Bill Wilkerson Center

Conclusions and Comments

- Limitations of study
 - Small sample size
 - Success depends on patient as an accurate historian
 - Need for pediatric version of this structured interview with 35% of pediatric dizziness from migraine
- Merits of study
 - Standardized assessment
 - Provides a means for creating an hypothesis "diagnosing" (per Neuhauser criteria) in the context of the BFT

Vanderbilt Bill Wilkerson Center

VANDERBILT UNIVERSITY

11 HANBYLLER, TENNESSEE 37240

Telephone (615) 933-7311

Office of the Dean - The Graduate School - Drive Plaza 322 2071

March 14, 1974

Mr. Gary D. Jacobson
2910 Evans Avenue # 212
Stevens Pt., Wisconsin 54481

Dear Mr. Jacobson:

We regret to inform you that the Graduate School of Vanderbilt University has not found it possible to respond favorably to your application for admission and financial award. Because of the large number of applicants for the 1974-75 session, many otherwise well-qualified students could not be accepted for admission.

We are sorry that we cannot admit you to the Graduate School and hope you will be able to continue your studies elsewhere.

Sincerely yours,

Edward Ferguson
Registrar, The Graduate School

Effects of fluvoxamine on anxiety, depression, and subjective handicaps of chronic dizziness patients with or without neuro-otologic diseases

Arata Horii^{1*}, Atsuhiko Ueno, Tadashi Kitahara, Keiji Mitani, Chisako Matsumura, Kazuo Kizawa and Taketoshi Kubo
¹Department of Otolaryngology, Osaka University School of Medicine, Osaka, Japan

Vanderbilt Bill Wilkerson Center

Introduction

- Two problems in the treatment of dizzy patients
 - Some dizzy patients demonstrate normal q-tests
 - Some patients are abnormal on tests but do not respond to conventional vertigo medications

Vanderbilt Bill Wilkerson Center

Introduction

- Investigators suggested:
 - dizzy patients without abnormal q-tests most likely had psychiatric disorders
 - dizzy patients with positive tests without improvement on antivertigo medications had pre-existing psychiatric disorder
 - Appropriate treatment of the psychiatric disorder would result in "remission of dizziness."

Vanderbilt Bill Wilkerson Center

Introduction

- Suggested that dizzy patients without positive neurotologic findings would:
 - ...have abnormal Hospital Anxiety and Depression Scale (HADS) scores and Dizziness Handicap Inventory (DHI) scores and
 - ...demonstrate improvement with a selective serotonin re-uptake inhibitor (SSRI)

Vanderbilt Bill Wilkerson Center

Introduction

- **Hypothesis: The SSRI would be effective on self-report handicaps and anxiety/depression in neurotology patients by “acting on their possible co-morbid psychiatric disorders”**
 - Predicted a positive correlation between scores on the HADS and the DHI

Vanderbilt Bill Wilkerson Center

Methods

- Treated 60 (41) consecutive dizzy patients with or without neurotologic diseases using Luvox (fluvoxamine) which is a selective serotonin reuptake inhibitor (SSRI)
- Outcome measures:
 - “slightly modified” Japanese translation of the DHI.
 - 14 items
 - 1 (no handicap) - 5 scale (severe handicap)scale
 - Max. score = 70 pts

Vanderbilt Bill Wilkerson Center

“Slightly modified” Japanese adaptation of “Jacobson’s Dizziness Handicap Inventory”

Table 1
The dizziness and unsteadiness questionnaire

1. Do you often have going out of walking or standing for 10-15 min or more?

0: always
 1: frequently
 2: sometimes
 3: rarely
 4: never

2. Do you have walking or standing more than 10 min due to dizziness or unsteadiness?

0: absolutely
 1: significantly
 2: moderately
 3: slightly
 4: not at all

3. Do you have going downstairs due to dizziness or unsteadiness?

4. Do you feel nervous due to dizziness or unsteadiness?

5. Do you feel like you are not able to do your work when you have dizziness or unsteadiness? (e.g. when walking, etc.)

6. Do the degree of dizziness or unsteadiness change when you undergo medical treatment?

7. Do you feel like you have a general feeling of not being able to do things due to dizziness or unsteadiness?

8. Do you feel like you have a general feeling of not being able to do things due to dizziness or unsteadiness?

9. Are you unable to concentrate on anything due to dizziness or unsteadiness?

10. Do you think it is very hard to find a good job or a career because of dizziness or unsteadiness? Or do you have some trouble in finding them?

11. In the degree of dizziness or unsteadiness experienced when you stand up (DHI-U)?

12. Do you feel anxious about yourself when you are in the presence of others due to dizziness or unsteadiness?

13. Do you believe that getting to get to work your family or society due to dizziness or unsteadiness?

14. Do you have any other symptoms due to dizziness or unsteadiness?

Vanderbilt Bill Wilkerson Center

Dizziness and Unsteadiness Questionnaire

- Administered the HADS and DHI before and then after 8 weeks of pharmacotherapy
- Week 1 – 100 mg/Luvox per day po
- Week 2-8 – dosage increased to 200 mg/day.

Vanderbilt Bill Wilkerson Center

Methods

- Hospital Anxiety and Depression Scale (HADS)
 - 14 item
 - validated,
 - self-report measure of anxiety and depression

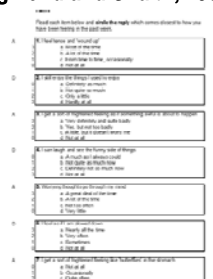

Vanderbilt Bill Wilkerson Center

Hospital Anxiety and Depression Scale (HADS)
Zigmond and Snaith, 1983

Maximum anxiety subscale score = 21 points
Maximum depression subscale score = 21 points
Abnormal for us = ≥ 11 points

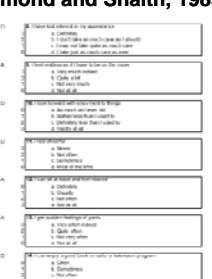

Cut-off of 8 points yields specificity of .78 and sensitivity of .9 for anxiety and specificity of .79 and sensitivity of .83 for depression Bjelland et al. (2002)

Vanderbilt Bill Wilkerson Center

Hospital Anxiety and Depression Scale (HADS)
Zigmond and Snaith, 1983

These investigators used a cut-off value of 12 points (92% sensitivity and 90% specificity)

Vanderbilt Bill Wilkerson Center

Methods

- Otoneurological examination =
 - spontaneous nystagmus test,
 - caloric test,
 - posturography and
 - pure tone audiometry
- Patients were diagnosed based on Japan Society for Equilibrium Research criteria

Vanderbilt Bill Wilkerson Center

Methods

- Began with 60 subjects, final group = 41 subjects
- Patients divided into 2 groups.
- Group 1 (N = 19, mean duration of dizziness = 19 months) = patients with neurologic diseases (peripheral impairments),
- Group 2 (N = 22, mean duration of dizziness = 21 months) = patients with normal neurologic findings

Vanderbilt Bill Wilkerson Center

Results: Baseline Mean HADS Subscale Scores (≥ 12 points = abnormal)

	Depression	Anxiety
Group 1	7.5 (+/- 0.7)	8.5 (+/- 0.7)
Group 2	7.9 (+/- 0.9)	9.4 (+/- 0.6)

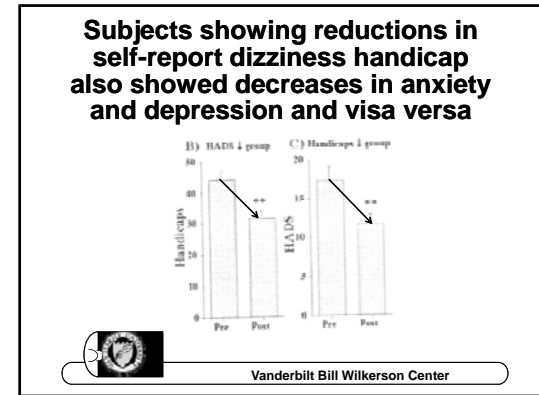

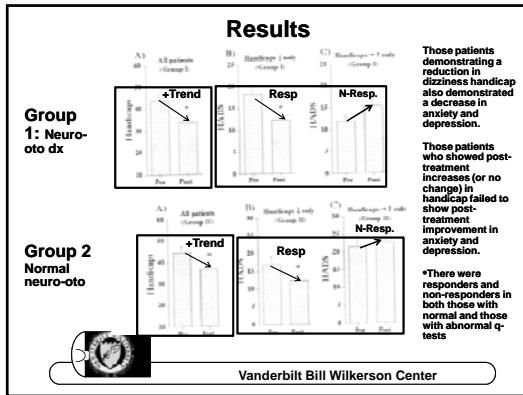

Vanderbilt Bill Wilkerson Center

Results

- Group 1 (Abnormal oto): Trend for self-report handicaps to be reduced following treatment...
- “Responders:” demonstrated a reduction in self-report handicap and demonstrated a significant reduction in post-treatment HADS
- “Non-responders”: no significant decrease in handicap or HADS
- Group 2 (Normal oto): Same trends were observed for subjects in Group 2 as in Group 1

Vanderbilt Bill Wilkerson Center

Discussion
Chronic Subjective Dizziness (CSD)

- 3 types of otoneurologic, psychiatric interactions (Staab and Ruckenstein, 2003):
 - otogenic = otoneurologic condition triggers psychiatric impairment,
 - psychogenic = psychiatric disorders are source of the dizziness,
 - interactive = where patient has a pre-existing psychiatric impairment that is exacerbated by a neuro-otologic event.

Vanderbilt Bill Wilkerson Center

Discussion

- Current study showed:
 - 70%+ of Groups 1 and 2 showed HADS scores ≥ 12 points (for either anxiety or depression)
- SSRI produced positive results in a limited number of patients
- Suggests that many patients with chronic dizziness may have comorbid psychiatric diseases (were the “responders” CSD patients?)
- Cannot rule out placebo effect since this was not placebo-controlled

Vanderbilt Bill Wilkerson Center

Conclusions

- Chronic dizziness in patients without evidence of neuro-otologic impairment suggest psychiatric disorders
- These can be identified with screening measures e.g. HADS
- Treatment with SSRI (e.g. Luvox) can reduce self-report dizziness handicap in patients with and without evidence of neuro-otologic impairment

Vanderbilt Bill Wilkerson Center

Conclusions

- Action of medication is on both co-morbid anxiety and depression that is either the primary source of dizziness or a reaction to neuro-otologic impairment
- More aggressive psychiatric interventions may be required for non-responders with high pretreatment HADS.

Vanderbilt Bill Wilkerson Center

Comments

- Illustration of how the HADS can be used in the clinic to:
 - identify subgroups of dizzy patients (anxious and/or depressed)
 - plan treatment
 - measure effects of treatment
- All patients visiting our clinic complete a DHI and a HADS (minimally)

Vanderbilt Bill Wilkerson Center

Article 4: "Expert" Case History - Background

Vanderbilt Bill Wilkerson Center

Introduction

- Case history taking of the dizzy patient can be a frustrating experience
- The clinician must:
 - obtain from the patient salient pieces of information in a short period of time
 - “digest” this information so that the examination of the patient can be tailored to the patient’s complaints.

Vanderbilt Bill Wilkerson Center

Introduction - Context

- A case history enables the clinician to generate hypotheses a list of suspects re: patient’s complaints (i.e. the differential diagnosis)
- Hypotheses accepted or rejected based on the results of semi-objective tests (e.g. neuro-imaging, electroneurodiagnostic tests).

Vanderbilt Bill Wilkerson Center

Introduction - Context

- Patients often complicate the history taking process by recounting information that, in fact, contributes little to the differential diagnosis
- Patients may feel they have been ignored if not given sufficient time to provide the clinician with information.
- Many who feel that the well-conducted case history is the most important part of the dizziness assessment (e.g. Baloh and Honrubia, 2001).

Vanderbilt Bill Wilkerson Center

Commodore Award!! Zhao et al. 2011

Order of Precedence
Awarded by the United States Navy & Marine Corps, Inc.

Predictive Capability of Historical Data
for Diagnosis of Dizziness

*Jeff G. Zhao, †Jay F. Fickelillo, †Edward L. Spitznagel, Jr.,
†Dorena Kallbogen, and †Hoel A. Goebel

*Washington University School of Medicine, †Department of Otolaryngology, Washington University School
of Medicine and †Division of Biostatistics, Washington University, St. Louis, Missouri, U.S.A.

Vanderbilt Bill Wilkerson Center

Introduction - Context

- A number of investigators have developed “expert” case history questionnaires
- If/Then algorithms modify the questions asked of the patient until a final “working diagnosis” is obtained.
- Attempts to develop these “expert” questionnaires have met with varied levels of success

Vanderbilt Bill Wilkerson Center

Introduction - Context

- There is a place in the dizziness clinic for an “expert diagnostic questionnaire.”
- The product of such a questionnaire could be viewed by the provider moments prior to the visit so that case history taking could be more focused on the possible sources of dizziness.

Vanderbilt Bill Wilkerson Center

Introduction - Context

- An “expert” case history device could be used by primary care providers who “gate” the referral of patients to specialists based on history (e.g. BPPV vs Meniere’s Syndrome).
- Lastly, to the extent that dizziness diseases/disorders are diagnosed in large part based on history a device of this type might assist in the determination of the final diagnosis

Vanderbilt Bill Wilkerson Center

Zhao: The Differential Diagnosis of Dizziness is Complicated

- Dizziness can be caused by e.g. vestibular, neurological and cardiological disorders, however,...
- Diagnosis often becomes the job of primary care or ER physicians (i.e. who have limited training, time and resources)
- Patient descriptions can be “unclear, inconsistent and unreliable.”

Vanderbilt Bill Wilkerson Center

Zhao: The Differential Diagnosis of Dizziness is Complicated

- Physician must rely on history and and PE to determine “next steps”
- When a correct diagnosis occurs often there are efficacious treatments
- In this context “...a simple, inexpensive, and accurate questionnaire-based diagnostic algorithm would be highly welcome.”

Vanderbilt Bill Wilkerson Center

For > 20 years

- The balance center at Washington University SOM, Department of Otolaryngology has used a clinical questionnaire completed by the patient before the appointment with the physician
- The questionnaire was used to identify subgroups of items that contributed to the eventual diagnosis...
- ...and to determine "...the power of ...sets of symptoms to distinguish between different diagnoses of dizziness"

Vanderbilt Bill Wilkerson Center

Methods

- Retrospective review of charts from N = 619 patients all with dizziness or postural instability.
- Mean age 57 years (sd 16 years, 40% male)
- 163 item questionnaire, 1 hour to complete
 - 86 questions specific to dizziness
 - 77 questions "general review of symptoms...overall health complaints"
- Some questions had 2 possible answers (e.g. yes/no) others were multichoice ("In which position are you the most dizzy?" (e.g. a, b, c, d))

Vanderbilt Bill Wilkerson Center

Questionnaire Study

- Content areas:
 - Description of the spell
 - Symptoms indicative of peripheral cause
 - Symptoms indicative of central cause
 - Auditory complaints
 - General physical and emotional health questions

Vanderbilt Bill Wilkerson Center

47-item Version of "Expert Questionnaire"

Washington University School of Medicine
Department of Otolaryngology-Head and Neck Surgery
Dizziness and Balance Center

Patient Name: _____ D.O.B: / / Sex: M F Date: / /

The following questions refer to your feeling of dizziness. Please answer them as "yes" or "no" and fill in all blanks.

Please describe in your own words, the sensation you feel without using the word "dizzy".

I. Do you ever have any of the following sensations?

- | | | |
|-----|---------------------------|----|
| Yes | Spinning in circles | No |
| Yes | Falling to one side | No |
| Yes | World spinning around you | No |

Vanderbilt Bill Wilkerson Center

Sample Questions Peripheral Cause of Dizziness

II. The following refer to a typical dizzy spells:

- | | | |
|-----|--|----|
| Yes | Do your dizzy spells come in attacks? | No |
| | How often? _____ | |
| | How long is the attack? _____ | |
| | Date of first spell? _____ | |
| Yes | Are you free from dizziness between attacks? | No |
| Yes | Does your hearing change with an attack? | No |
| Yes | Are you dizzy mainly when you sit or stand up quickly? | No |
| Yes | Are you dizzy in certain positions? | No |
| | Which position? _____ | |
| Yes | Are you nauseated during an attack? | No |
| Yes | Are you dizzy even when lying down? | No |
| Yes | Have you had a recent cold or flu preceding recent dizzy spells? | No |
| Yes | Have you had fullness, pressure, or ringing in your ears? | No |
| Yes | Have you had pain or discharge in your ear of recent onset? | No |
| Yes | Have you had trouble walking in the dark? | No |
| Yes | Are you better if you sit or lie perfectly still? | No |
| Yes | Do loud sounds make you dizzy? | No |

Vanderbilt Bill Wilkerson Center

Sample Questions CNS Cause of Dizziness

III. The following refer to other sensations you may have:

- | | | |
|-----|---|----|
| Yes | Do you black out or faint when dizzy? | No |
| | Have you had: | |
| Yes | Severe or recurrent headaches? | No |
| Yes | Light sensitivity with your headaches or dizziness? | No |
| Yes | Any double or blurry vision? | No |
| Yes | Numbness in your face or extremities? | No |
| Yes | Weakness or clumsiness in arms, legs? | No |
| Yes | Slurred or difficult speech? | No |
| Yes | Difficulty swallowing? | No |
| Yes | Tingling around your mouth? | No |
| Yes | Spots before your eyes? | No |
| Yes | Jerking of arms or legs? | No |
| Yes | Seizures? | No |
| Yes | Confusion or memory loss? | No |
| Yes | Recent head traumas? (If yes, please explain) | No |

Vanderbilt Bill Wilkerson Center

<http://links.lww.com/MAO/A45>
Sample Items Auditory Complaints

IV. The following refer to your hearing. Indicate which side has been affected:

Yes	Difficulty hearing in one ear?	Left	Right	Both	No
Yes	Ringing in one ear?	Left	Right	Both	No
Yes	Fatness in one ear?	Left	Right	Both	No
Yes	Change in hearing when dizzy?				No
	Have you had any of the following?				
Yes	Fain in ears?	Left	Right	Both	No
Yes	Discharge from ears?	Left	Right	Both	No
Yes	Hearing changes?				No
Yes	Better?	Left	Right	Both	No
Yes	Worse?	Left	Right	Both	No
Yes	Exposure to loud noises?				No
Yes	Previous ear infections?				No
Yes	Trauma to your ear(s)?				No
Yes	Previous ear surgery?				No
Yes	Family history of deafness?	What? _____			No

Vanderbilt Bill Wilkerson Center

General Physical and Emotional Health Questions

V. The following refer to habits and lifestyle:

Yes	Is there added stress to your life recently?	No
Yes	Are you dizzy or unsteady constantly?	No
Yes	Is your dizziness related to:	
Yes	Moments of stress?	No
Yes	Menstrual period?	No
Yes	Overwork or exertion?	No
Yes	Do you feel lightheaded or have a swimming sensation when you are dizzy?	No
Yes	Do you find yourself breathing faster or deeper when excited or dizzy?	No
Yes	Did you recently change eyeglasses?	No
Yes	Have you ever had weakness or faintness a few hours after eating?	No
Yes	Do you drink coffee?	How much? _____ No
Yes	Do you drink tea?	How much? _____ No
Yes	Do you drink soft drinks?	How much? _____ No
Yes	Do you drink alcohol?	How much? _____ No
Yes	Do you smoke? What? _____	How much? _____ No

Vanderbilt Bill Wilkerson Center

**Final Diagnoses
(64% with diagnoses)**

- BPPV – 26.5%
- Migraine associated dizziness- 16.3%
- Meniere's disease – 13.2%
- Vestibular neuritis – 7.9%
- Other vestibular – 9.0%
- Other central – 12.3%
- Other miscellaneous – 12.6%
- Unknown – 2.2%

Vanderbilt Bill Wilkerson Center

Diagnosis - BPPV

- Items positively correlated =
 - History of dizziness when laying down (OR = 9.7)
 - Position-dependent dizziness (OR = 3.6)
 - Attacks lasting seconds (OR = 2.8)
- Negatively correlated with
 - Hearing changes
 - Light sensitivity
 - Attacks lasting hours to days

Vanderbilt Bill Wilkerson Center

Diagnosis – Migraine Associated Dizziness

- Positively correlated with
 - Light sensitivity (OR = 41.8)
 - Menstrual cycles (OR = 6.9)
 - Severe recurrent headaches (OR = 5.5)
- Negatively correlated with
 - Tinnitus
 - Positional dizziness
 - Nocturnal urination

Vanderbilt Bill Wilkerson Center

Diagnosis – Meniere's Disease

- Positively correlated with
 - Auditory symptoms during an attack (OR = 7.5)
 - Unilateral worsening of hearing (OR = 7.4)
 - Unilateral tinnitus (OR = 6.2)
- Negatively correlated with
 - Positional dizziness
 - Recent head trauma
 - Mucus

Vanderbilt Bill Wilkerson Center

Vestibular Neuritis

- Positively correlated with:
 - Nausea (OR = 1.98)
- Negatively correlated with
 - Light sensitivity
 - Indigestion
 - Ear pain

Vanderbilt Bill Wilkerson Center

Results of Initial Study Enabled the Investigators to Reduce the Number of Items to 47

- Excellent predictive power (>80% sensitivity) for: BPPV, Migraine Associated Vertigo, Meniere's disease
- Good predictive power (> 70%) for vestibular neuritis

Vanderbilt Bill Wilkerson Center

Predictive Accuracy of 47-Item Device Zhao et al. 2010

TABLE 1. Predicted diagnosis by multinomial LR (direct entry method) versus ultimate clinical diagnosis (47 variables, 393 subjects, Cox and Staff R² = 0.928)

Observed	Predicted						Percent correct (%)
	BPPV	Migraine	Meniere's	Vestibular neuritis	Other vestibular	Other CNS	
BPPV	2	0	0	2	0	0	66.6
Migraine	0	4	0	1	1	2	62.4
Meniere's	0	1	1	0	0	0	66.6
Vestibular neuritis	0	0	0	1	1	0	66.6
Other vestibular	1	1	1	0	0	0	33.3
Other CNS	2	2	1	0	0	2	66.7
Other miscellaneous	3	0	1	0	2	0	66.6
Overall percentage (%)	33.3	17.8	14.2	6.9	8.1	9.2	75.8

Vanderbilt Bill Wilkerson Center

Predictive Accuracy of 32-Item Device However the Sensitivity Suffered Zhao et al. 2010

TABLE 4. Predicted diagnosis by multinomial LR (direct entry method) versus ultimate clinical diagnosis (simplified model of 32 variables)

Observed	Predicted						Person count (%)	
	BPPV	Migraine	Meniere's	Vestibular neuritis	Other vestibular	Other CNS		Other nonvestibular
BPPV	98	5	2	3	2	6	6	29.2
Migraine	4	82	6	5	3	3	1	77.4
Meniere's	3	1	49	4	2	0	0	53.1
Vestibular neuritis	0	1	4	11	2	0	1	18.4
Other vestibular	3	1	3	1	22	4	1	32.0
Other CNS	0	4	1	0	3	24	5	35.6
Other nonvestibular	0	3	2	0	1	4	36	62.9
Overall percentage (%)	32.7	15.7	12.0	5.6	8.5	9.9	12.6	71.4

Vanderbilt Bill Wilkerson Center

Discussion

- For adult patients, the predictive power of the questionnaire was good than demonstrated in the past
- Why? 3 of the diagnoses had factors that were both sensitive and specific
 - e.g. positional dizziness and brief duration – BPPV
 - e.g. Light sensitivity and association with menstruation – Migraine Associated Vertigo
 - e.g. Auditory symptoms during spells and tinnitus – Meniere's disease

Vanderbilt Bill Wilkerson Center

Discussion

- Not so sensitive for vestibular neuritis
 - these patients often had 2 types of vertigo (e.g. short-lasting BPPV and long-lasting neuritis)
 - The best predictive factor was nausea and that was only OR = 1.98
- Unable to reduce factors to 32 and maintain power.
- Results represented a “testament to the usefulness of a structured questionnaire as an initial evaluation tool for dizziness”

Vanderbilt Bill Wilkerson Center

Comments

- **Merits of questionnaire**
 - Ability to render a hypothesis re: the origin of dizziness before formal testing is begun (that hypothesis is supported or rejected based on results of quantitative tests)
 - Could be used in tandem with bedside (pre)tests
 - Could be used by primary care to determine which patients require referral to specialists

Vanderbilt Bill Wilkerson Center

Comments

- **Problems with questionnaire**
 - Suggested diagnosis is not always correct
 - Questionnaire might be used in an inappropriate manner (e.g. for diagnosis)
 - *Critically dependent on patient as an accurate historian*

Vanderbilt Bill Wilkerson Center

Conclusion

- “The capability of historical data to accurately predict the ultimate diagnosis for dizziness emphasizes the importance of a structured questionnaire in the evaluation of such patients.”
- Future: computerized administration for online use?

Vanderbilt Bill Wilkerson Center

Vanderbilt University
1st Attempt
Quantitative Dizziness
Questionnaire
(qDq)

Vanderbilt Bill Wilkerson Center

qDq

- An attempt to make the conventional case history more directive and quantitative
- Case history questions were converted into 33 statements placed statistically into 6 subscales (migrainous vertigo, positional vertigo, hydrops, Tullio/SCD, multisensory system impairment, chronic subject dizziness-CSD)
- Response to each statement is a 5 point Likert scale (0 = strongly disagree, 2 = neutral, 4 = strongly agree)

Vanderbilt Bill Wilkerson Center

“qDq”

Item	Strongly disagree	Neutral	Strongly agree
101 I get headaches often	0	2	4
102 When I get a headache I often get dizzy too	0	2	4
103 I have a dizzy spell that becomes worse if I do not lay down	0	2	4
104 Headaches influence how substantial you will eat	0	2	4
105 Many numbers of my non-dominant hand get headaches	0	2	4
Pw*			
171 I get dizzy when I change the position of my head, or head and body	0	2	4
172 I get dizzy when I turn over on my side in bed	0	2	4
173 I get dizzy when I turn from a sitting to a standing position	0	2	4
174 I get dizzy when I tilt my head up to look at something above me	0	2	4
175 I get dizzy for a few seconds if I turn my head quickly left-to-right, or right-to-left	0	2	4
176 I get dizzy quickly when I turn my head	0	2	4
Hvd			
191 I get dizzy in one ear if I get a cold, sinus, and/or other ears	0	2	4
192 There are times that I find or make a small hole in my ear when I'm dizzy	0	2	4
193 There is a continuous sound, like ringing, buzzing, roaring, or whistling in one ear only	0	2	4
194 I have a sense of pressure in one ear that causes dizziness	0	2	4
195 My hearing becomes poorer just prior to, or during, dizzy spells	0	2	4
Tullio-SCD			
196 Loud sounds make me dizzy	0	2	4
197 When I cough I get dizzy	0	2	4
198 I get dizzy when I sneeze	0	2	4
199 Loud sounds such as heavy traffic are unusual loud sounds	0	2	4
200 I get dizzy when I get heavy traffic	0	2	4
201 I get dizzy when I have a loud conversation	0	2	4

Vanderbilt Bill Wilkerson Center

“qDq”

Mild/Seas						
MCI	I get motion or space poor	0	1	2	3	4
MFO	Things in the distance look blurry or fuzzy to me	0	1	2	3	4
MFO	I find it difficult to read the news or notices on a sign	0	1	2	3	4
MFA	After that and to it, often get numb and cold	0	1	2	3	4
MFO	I have poor reactions to my feet and toes	0	1	2	3	4
MFO	I get tingles and numbness	0	1	2	3	4
ZYB						
FYB	I have spots where I get dizzy and find it difficult to breathe	0	1	2	3	4
FYB	I have spots where I get dizzy, my eye get numb and/or my hands "tingle"	0	1	2	3	4
FRK	I get spots where I feel like I have a "lump" in my throat	0	1	2	3	4
FRK	I have eye spots where I get blurry or headache	0	1	2	3	4
FRK	I have spots where my chest gets tight or that it is difficult to breathe	0	1	2	3	4

Vanderbilt Bill Wilkerson Center

qDq Data Views

- At it's simplest, the qDq provided a "snapshot" of what is the patient's primary complaint, and possibly, their final diagnosis.
- Our suggestion is that a mean subscale score of 2.5 points or greater represents an endorsement of that subscale
- Examples follow

Vanderbilt Bill Wilkerson Center

Patient with a Diagnosis of Migrainous Vertigo DHI = 24/100 Mild SRH

Vanderbilt Bill Wilkerson Center

Patient with a Diagnosis of BPPV
DHI = 42/100 Moderate SRH

Vanderbilt Bill Wilkerson Center

Patient with a Diagnosis of Meniere's D.
DHI = 50/100, Severe SRH

Vanderbilt Bill Wilkerson Center

Patient with a Diagnosis of Chronic Subjective Dizziness
DHI = 62/100, Severe SRH
HADS, Anxiety 13/21, Depression 11/21

Vanderbilt Bill Wilkerson Center

**Patient with Normal Balance Function Testing (i.e. positive predictive value?)
DHI 60/100 Severe SRH**

Vanderbilt Bill Wilkerson Center

**“Diagnostic Case History”
Initial Experience**

- N = 56 (mean age 58 yrs, sd 16 yrs, 23 male)
- 4 diagnoses: **migrainous vertigo, BPPV, Meniere’s Syndrome, multifactorial dizziness**
- **Discriminant Analysis**

Dx Groups	Correct Classification
Migrainous vertigo	71%
Positional	64%
Meniere’s syndrome	60%
Multifactorial dz	67%

Vanderbilt Bill Wilkerson Center

Summary

- 3 ½ measures are quick to administer and provide the clinician that information that may be useful for the prediction of what will be the final diagnosis of patients with vertigo and dizziness
 - Mini DHI – positional vertigo
 - HADS – anxiety related dizziness (e.g.CSD)
 - SIM-V – migrainous vertigo
 - “Expert” case history – assist in the final diagnosis of multiple diseases/disorders

18	34.0	89.7	12	271	18	72	2.29

RPVY, benign paroxysmal positional vertigo.

Vanderbilt Bill Wilkerson Center

What explains the relatively low sensitivity of the mini-DHI

- Frail, obese, patients post-CVA, orthopedically compromised difficult to position
- Items chosen for mini DHI are not just sensitive to BPPV but also other disorders affecting the vestibular system
- Patients as poor historians
- Time of day tested (more likely to see BPPV in AM. In PM otoliths have been distributed)
- Duration of patient's symptoms and co-morbidities were not recorded

Performance Characteristics of the 2-item mini-DHI

TABLE 4. Sensitivity, specificity, and frequencies for true- and false-positive and true- and false-negative findings plus the likelihood ratios for the sum of two Dizziness Handicap Inventory items (getting out of bed and rolling in bed) in identification of benign paroxysmal positional vertigo

Sum of item scores (getting out of bed + rolling in bed) n	Sensitivity (%)	Specificity (%)	True-positive n	True-negative n	False-positive n	False-negative n	Likelihood ratio
2/5	83.0	33.4	48	97	192	16	1.22
4/5	71.4	54.7	60	138	121	24	1.38
5/5	54.4	72.2	24	218	71	50	1.02
175	20.2	90.0	12	200	29	02	2.61

Dizziness Handicap Inventory
Jacobson and Newman (1990)

- Document +/- changes over the course of rehabilitation
- Scores have been correlated with falls
- Has become ubiquitous as a balance outcome measure
